

Low fidelity cart page

Mid-fidelity mock up

Despite having created a mid fidelity mock up of my cart page for homework 5, I still found it useful to sketch the page in low fidelity. I used the sketch to draw my html structure for divs and how I would use flex box to display elements. The different colors above show the different divs and flex options.

The cart design maintains the clean, simplistic aesthetic from the rest of the design with clear strong calls to action. It offers the user the option to keep shopping, edit their cart item and the option to check out. One change I made was increasing the prominence of the 'edit' and 'delete' controls, specifically, making the delete call to action a button as opposed to the smaller icon. While delete might not be the ideal action we want a user to take, for business reasons, it is still important that the user can clear their cart iff they made a mistake.
